

Company Profile

IT Risk & GRC Home Lab | MapleCare Health Services

1. Company Overview

MapleCare Health Services is a fictional healthcare organization based in Canada. The organization provides outpatient healthcare support, appointment coordination, patient record management, billing support, and administrative services.

MapleCare has approximately 150 employees across clinical, administrative, finance, human resources, operations, and IT functions. Because the organization handles patient information, employee records, billing data, and internal business documents, information security and risk management are important to its daily operations.

This company profile provides the business context for the IT Risk and GRC Home Lab project.

2. Business Environment

MapleCare relies on several technology systems to support daily work.

Employees use Microsoft 365 for email, Teams communication, document creation, file sharing, and productivity. SharePoint is used to store internal documents, policies, reports, and team files. The Patient Records System is used to manage patient information, appointment notes, and service records.

The organization also uses an HR Management System to manage employee records, onboarding, and offboarding. A third-party Billing Vendor Portal supports billing, payment records, and financial processing.

In addition to these systems, MapleCare depends on staff laptops, Wi-Fi access, backup processes, vendor onboarding, user access management, patch management, security awareness training, and incident response procedures.

These systems support the business, but they also introduce cybersecurity, privacy, vendor, and operational risks.

3. Key Business Functions

Business Function	Description
Patient Services	Supports appointment coordination, patient communication, and patient record management
Administration	Manages internal documents, policies, scheduling, and operational support
Finance	Handles billing, invoices, payment records, and vendor-related financial activities
Human Resources	Manages employee records, onboarding, offboarding, and access requests
Information Technology	Supports systems, user accounts, devices, backups, security controls, and incident response
Operations	Coordinates internal processes and helps ensure business activities run smoothly

4. Key Systems and Processes

System / Process	Purpose
Microsoft 365	Email, Teams communication, productivity, and file collaboration
SharePoint	Internal document storage and file sharing
Patient Records System	Stores and manages patient health information
HR Management System	Stores employee records and supports HR processes
Billing Vendor Portal	Supports billing, payment processing, and financial records
Endpoint Devices	Laptops and desktops used by staff
Wi-Fi Network	Provides network access to staff and approved users
Backup Process	Supports recovery of important systems and data
User Access Management Process	Manages account creation, access changes, and account removal
Vendor Onboarding Process	Reviews and approves third-party vendors
Incident Response Process	Guides how the organization responds to cybersecurity incidents
Security Awareness Training Process	Helps employees understand phishing, password safety, and data handling
Patch Management Process	Supports regular system and device updates
Data Classification Process	Helps identify and protect sensitive information
Business Continuity Process	Helps the organization continue operating during disruption

5. Sensitive Data Handled

Data Type	Example	Main Risk Concern
Patient Information	Patient records, appointment notes, health-related information	Privacy breach or unauthorized access
Employee Information	Employee profiles, payroll-related records, contact details	Privacy breach or misuse of employee data
Financial Information	Billing records, invoices, payment information	Fraud, vendor risk, or data exposure
Internal Business Documents	Policies, reports, procedures, operational files	Unauthorized access or accidental sharing
User Account Information	Login records, access permissions, account details	Account compromise or privilege misuse

6. Current Risk Concerns

MapleCare does not yet have a mature GRC process. Risk information is not centrally documented, and there is no formal risk register. Some controls may exist, but leadership does not have a clear view of which risks are highest, which controls are working, and which issues need urgent attention.

The main concerns for the organization include:

- MFA may not be enforced for all users
- User access may not be reviewed regularly
- Former employees may retain access after leaving
- Vendor security evidence may not be reviewed before onboarding or renewal
- Backups may not be tested regularly
- Incident response documentation may be outdated
- Security awareness training may not be fully tracked
- SharePoint permissions may be too broad
- Patch management may not be consistently documented
- Sensitive data may not be clearly classified
- Audit evidence may not be collected consistently
- Remediation actions may not be centrally tracked

7. Why a GRC Assessment Is Needed

A GRC assessment is needed to help MapleCare understand its main IT and cybersecurity risks. The assessment will help leadership identify which systems and processes are most critical, where control gaps exist, which risks require immediate action, and what evidence would be needed to support audit readiness.

The assessment will also help MapleCare create a more structured process for documenting risks, assigning ownership, tracking remediation, and reporting risk status to management.

8. Link to the Next Deliverable

This company profile provides the business context for the next step of the project: the IT Asset and Process Inventory.

The asset and process inventory will list MapleCare's key systems, business owners, data types, criticality, risk levels, and main risk concerns.
